6 Basic Components Of Pneumatic System - DAS Services

The pneumatic system basically consist following main components : Pneumatic cylinders, rotary actuators, and motors provide movement and force for the pneumatic system, for moving, holding and processing of materials and assemblies. To control and operate these actuators, other pneumatic components are needed such as a compressor for preparation of compressed air, reservoir tank to store the compressed air, FRL unit for filtration of compressed air, and control valves for the control of ...

Basic Concepts of Pneumatics

A - Compressor: a pump which compresses air, raising it to a higher pressure, and delivers it to the pneumatic system (sometimes, can also be used to generate a vacuum). B - Check valve: one-way valve that allows pressurized air to enter the pneumatic system, but prevents backflow (and loss of pressure) into the compressor when it is stopped. C - Accumulator: stores compressed air ...

Pneumatic systems are used in controlling production lines and are also used mechanical clamps, rock drills, hammer drills, grinders, conveyers, automobiles brakes and doors, dentistry applications etc. A basic Pneumatic system consists of the following four components: Compressor:A compressor compresses air up to the required pressure. It converts the mechanical energy of motors and engines to potential energy of compressed air.
