David Mumford was born on June 11, 1937 in England and has been associated with Harvard University continuously from entering as freshman to his present position of Higgins Professor of Mathematics. Mumford worked in the fields of Algebraic Gemetry in the 60's and 70's, concentrating especially on the theory of moduli spaces: spaces which classify all objects of some type, such as all curves of a given genus or all vector bundles on a fixed curve of given rank and degree.

Introduction. Robin Hartshorne studied algebraic geometry with Oscar Zariski and David Mumford at Harvard, and with J.-P. Serre and A. Grothendieck in Paris. After receiving his Ph.D. from Princeton in 1963, Hartshorne became a Junior Fellow at Harvard, then taught there for several years. In 1972 he moved to California where he is now Professor at the University of California at Berkeley.

I worked in algebraic geometry from 1959 to 1982. All my papers in this field have been published by Springer-Verlag in two volumes, (a) Selected papers on the Classification of Varieties and Moduli Spaces , and (b) Selected papers II, on Algebraic Geometry including Correspondence with Grothendieck .I am linking this web site to my personal scans of my personal reprints of most of these ...

David Mumford | Work in Algebraic Geometry

Introduction. Mumford's famous Red Book gives a simple readable account of the basic objects of algebraic geometry, preserving as much as possible their geometric flavor and integrating this with the tools of commutative algebra. It is aimed at graduate students or mathematicians in other fields wishing to learn quickly what algebraic geometry is all about.

As with a number of Fields Medalists, Mumford's prizewinning work was in algebraic geometry. In some of his early work, Mumford took up David Hilbert's theory of invariants and applied it to new geometric problems couched in Alexandre Grothendieck's theory of schemes. He continued the efforts of Oscar Zariski in making both algebraic and rigorous the work of the Italian school of algebraic geometers on the subject of algebraic surfaces.

From the reviews: "Although several textbooks on modern algebraic geometry have been published in the meantime, Mumford's "Volume I" is, together with its predecessor the red book of varieties and schemes, now as before one of the most excellent and profound primers of modern algebraic geometry. Both books are just true classics!"

David Mumford- Selected Papers, Volume II

Algebraic geometry is a branch of mathematics, classically studying zeros of multivariate polynomials. Modern algebraic geometry is based on the use of abstract algebraic techniques, mainly from commutative algebra, for solving geometrical problems about these sets of zeros. The fundamental objects of study in algebraic geometry are algebraic varieties, which are geometric manifestations of solutions of systems of polynomial equations. Examples of the most studied classes of algebraic varieties
