Abstract. Bootstrap methods are a collection of sample re-use techniques designed to estimate standard errors and confidence intervals. Making use of numerous samples drawn from the initial observations, these techniques require fewer assumptions and offer greater accuracy and insight than do standard methods in many problems.

The Bootstrap Sampling Method. The basic idea of bootstrap is make inference about a estimate(such as sample mean) for a population parameter θ (such as population mean) on sample data. It is a resampling method by independently sampling with replacement from an existing sample data with same sample size n , and performing inference among these resampled data.

Bootstrap Idea Use as an estimate the quantity $\mu(\hat{F})$ instead of $\mu(F)$. Since \hat{F} is a consistent estimate of F (i.e. $\hat{F} \rightarrow F$ if $n \rightarrow \infty$) then $\mu(\hat{F}) \rightarrow \mu(F)$. Important: $\mu(\hat{F})$ is an exact result. In practice it is not easy to find it, so we use a Monte Carlo approximation of it. So, the idea of bootstrap used in practice is the following:
