An Introduction to Time Waveform Analysis

We now know that the time it takes for electrical waveforms to repeat themselves is known as the periodic time or period which represents a fixed amount of time. If we take the reciprocal of the period, ($1/T$) we end up with a value that denotes the number of times a period or cycle repeats itself in one second or cycles per second, and this is commonly known as Frequency with units of Hertz, (Hz) .

Electrical Waveforms and Electrical Signals

A waveform is a digitized recreation of very dynamic voltage changes over time. Here is how they are typically generated... The discrete changes in an input signal are rectified in an instant through a process called "Pulse Code Modulation" (PCM). Simply put, PCM assigns a bit value to each sample at whatever sampling rate you're running.

Generally we will represent AC waveform by Sinusoidal waveform and its mathematical formulae is. $A(t) = A \sin(2\pi ft)$ Where , A is Amplitude of signal. t is the time period. f is the frequency of signal. In the process of generation of AC current , a wire or coil is rotated in a magnetic field produced by 2 magnets.

Time waveform analysis is the ideal tool when diagnosing a range of fault conditions, including rolling element bearing faults, faults associated with gears, cavitation, rubs, looseness and more - any time the vibration may include impacts, modulation, beats, rubs, transients, and random bursts of energy, time waveform analysis is the best data to view.

Introduction to Time Waveform Replication This class explores the basic process of reproducing and controlling a time waveform for shaker testing. A controller will be present for demonstration of practical techniques on how to perform a Time Waveform Replication (TWR) test. Examples of error calculations will be included.

Introduction to Time Waveform Replication

The voltage of a waveform at a given instant in time is called "Instantaneous voltage". In the above diagram $v_1, v_2, v_3, v_4, v_5, v_6, \dots$ are the instantaneous voltages of the sine wave. To find the instantaneous voltage value of the sine wave, we depend on Maximum voltage of the sine wave. Instantaneous voltage = Maximum voltage $\times \sin \theta$

Weirdly, there is no mention of ventilator waveforms in the 2017 version of the CICM primary syllabus, but by the time they are ready for the Part II exam the trainees are expected to have some considerable mastery of this topic (judging by the complex waveforms they need to interpret in SAQs such as Question 11.3 from the second paper of 2017).

A periodic waveform repeats over time at a fixed interval called the period and the number of waveform cycles observed in one second is called the frequency. A waveform that is periodic over some time interval has an instantaneous frequency defined on that time interval as the reciprocal of the period.

Introduction to waveform generation

Introduction to Waves. A wave is a disturbance that moves through space or matter. Examples include water waves, sound and light. ... Frequency is how often something happens per unit of time, usually per second. When frequency is per second it is called "Hertz" (Hz).

The main purpose of an oscilloscope is to graph an electrical signal as it varies over time. Most scopes produce a two-dimensional graph with time on the x-axis and voltage on the y-axis. An example of an oscilloscope display. A signal (the yellow sine wave in this case) is graphed on a horizontal time axis and a vertical voltage axis.

The function vis called a time-domain representation of the waveform because it is a function that specifies the waveform and whose domain is time (meaning that it maps time into voltage). The alternate representation of v can be denoted (A, ϕ) .
