and Answers

Protein synthesis and DNA replication are two mechanisms where double-stranded DNA molecules are involved in the initial template. Protein synthesis is the synthesis of an amino acid sequence of a protein. DNA replication is the synthesis of a new DNA molecule from an existing DNA molecule. The main difference between protein synthesis and DNA replication is the mechanism and the final product of the two processes. References: 1.

Difference Between Protein Synthesis and DNA Replication ...

We're talking about how to recongize the two major

Board exams as well as competitive exams. These short solved questions or quizzes are provided by Gkseries.

Protein Synthesis Multiple Choice Questions and Answers ...

Replication follows several steps that involve multiple proteins called replication enzymes and RNA. In eukaryotic cells, such as animal cells and plant cells, DNA replication occurs in the S phase of interphase during the cell cycle. The process of DNA replication is vital for cell growth, repair, and reproduction in organisms.

Viral Structure And Replication Answers

REPLICATION. Viral replication is broadly a two-stage process; both viral proteins and nucleic acid must be replicated to form new virus particles. A. VIRAL PROTEIN PRODUCTION. Viruses must first transcribe their genetic material into messenger RNA (mRNA) in order to use host ribosomes to produce new viral proteins.
