Tutorialspoint Propagation Vir History

While discussing transmitter and receiver circuitry we did not have to know much about antennas or propagation. It sufficed to know only that a voltage applied to the terminals of a transmitting antenna causes a proportional voltage to appear very shortly thereafter at the terminals of a

receiving antenna. To be more exact, it was sufficient to know that everything between the terminals of the two antennas is equivalent to a linear two-port network.

Propagation is that part where the signal is transferred from the transmitter to the receiver. This involves the use of antennas or aerials to radiate the signal as an electromagnetic wave, and then there is the way that the electromagnetic wave travels or propagates between the transmitting antenna and the receiving one. Thus antennas and

Propagating systems, signals are radiated in space as an electromagnetic wave by using a receiving transmitting antenna and a fraction of this radiated power is intercepted by using a receiving antenna. Thus, an antenna is a device used for radiating or receiver radio waves.

Propagation History
A suitable antenna is driven by a radio transmitter it radiates energy into free space in the form of Electromagnetic (EM) Waves. EM waves are produced by a complex mechanism. In close vicinity to the antenna (within $1/2\lambda$ to 1λ), the energy field is called induction field.
