A Rotary Vacuum Filter Drum consists of a drum rotating in a tub of liquid to be filtered. The technique is well suited to slurries, and liquids with a high solid content, which could clog other forms of filter. The drum is pre-coated with a filter aid, typically of diatomaceous earth or Perlite. After pre-coat has been applied, the liquid to be filtered is sent to the tub below the drum. The drum rotates through the liquid and the vacuum sucks liquid and solids onto the drum pre-coat surface, t

The Encoded Digital Guidance (EDG) system is designed to improve filtration performance and reduce energy costs. The EDG-trac Knife Advance system is an ancillary system for a rotary vacuum drum filter (RVDF), which consists of an advancing knife, single motor gear drive, and associated controls. In the EDG-trac Knife Advance system, accumulated solids are cut away from the filter drum surface much more efficiently, while maintaining acceptable solids separation and improving liquid throughput.

~~Rotary Drum Vacuum Filters - Komline-Sanderson~~

The rotary drum vacuum filter is a very versatile liquid/solid separation device. It is used where a continuous separation of a solid from a liquid stream is desired. It can be used in process applications where the solid is the product or where the liquid is the product (and sometimes when both phases are the product).
