Bean Lab Report Due Thurs. October 23rd Bean Lab Report Six Objectives You already know how to. Obj #1: Compile daily recorded data onto a summary data sheet. Obj #2: Graph data to represent your results. Today you will now learn how to.

~~Bean Lab Report~~ ~~Weebly~~

The Bean Allele Frequency Lab Purpose: The following pictures are a guide to show one example of how the allele frequency could change in a population due to a genetic disorder. Setup: The three types of beans (red [RR], pinto [Rr] and white [rr]) will be used to represent a population of individuals with a certain trait.

~~The Bean Lab: Allele Frequency~~

There are a total of 100 beans in your bag (50 Black Beans = non-renewable and 50 White Beans = renewable). Have one student (can't be the same person as in part I) blindfold themselves and then pull out 10 beans. Count the number of black and white beans. Enter each number in the table below under the Year 1 column.

Calculate the average length and width of the beans in your sample. Fill in Data Table 1 with your averages. Fill in the data chart on the board (for class data) with your averages. Mass. Measure the mass of all your beans using the balance and record measurements in Data Table 2. Calculate the average mass of the beans in your sample.

~~Lima Bean Lab~~ ~~eisd.org~~

The calculated number of beans in one relative mass stayed the same at  $16.7 \pm 0.1$  bean. The measured number stayed constant at  $17 \pm 1$  bean. The lima bean relative mass is about 17 times larger than the lentil bean relative mass. There are 17 beans in a relative mass. These values are the same.

~~Laboratory Activity 1: Teacher Notes Continued~~

Answers to Discussion Questions (Student answers will vary.) 1. The atomic mass of the bean bag element (Bg) represents a weighted average of the mass of each isotope and its relative abundance. Use the following equation to calculate the atomic mass of Bg. Note: Divide the percent abundance of each iso-tope by 100 to obtain its relative abundance.
