The Brushless DC Motor control solution generates the 3 phase duty signals (U, V, and W) to the gate driver via 6 channels PWM function. The gate driver controls the MOS to drive motor rotation. Because the system is close-loop controlled, once the load changed, the motor speed will calibrate automatically by target speed and real speed.

The MDC100-050101 driver is designed to drive DC brushless motors at currents of up to 10A (peak) and 50V. Using hall sensor feedback, a constant velocity mode can be selected. The driver is protected against over current (cycle-by-cycle), hall sensor error and under voltage. When an error occurs, a fault light is turned on to notify the user.
