Regression Models for Categorical and Limited Dependent Variables. "J. Scott Long's approach is one that I highly commend. There is a decided emphasis on the application and interpretation of the specific statistical techniques. Long works from the premise that the major difficulty with the analysis of limited and categorical dependent variables (LCDVs) is the complexity of interpreting nonlinear models, and he provides tools for interpretation that can be widely applied across the different ...

"Regression Models for Categorical and Limited Dependent Variables excels at explaining applications of nonlinear regression models. . . The book provides much practical guidance for the estimation, identification, and validation of models for CLDVs. Each chapter is interspersed with exercises and helpful questions.

Regression with Categorical Dependent Variables

In statistics, a categorical variable is a variable that can take on one of a limited, and usually fixed, number of possible values, assigning each individual or other unit of observation to a particular group or nominal category on the basis of some qualitative property. In computer science and some branches of mathematics, categorical variables are referred to as enumerations or

looked at models that require a
continuous dependent variable. Next,
let's move on to categorical
independent variables. A categorical
variable has values that you can put
into a countable number of distinct
groups based on a characteristic.

A nice review of MLE-based methods for categorical, limited, and ordinal dependent variables. Most social science data is best thought of as categorical, ordinal, etc., not interval, and so a readable treatment of one approach to the analysis of such data that does not rely on intervality assumptions is worthwhile.

Variables and censored outcomes interpretation of models with categorical dependent variables. A further difference is that, as the title suggests, limited dependent variables are beyond the scope of this book. Each chapter is preceded by a brief explanation of the statistical issues but lacks the depth of discussion in Long (1997). A large part of the book is devoted to post-
