Cytokinesis is the final stage of cell division, during which the cytoplasm splits into two and two daughter cells form. Figure 7.3. 8. Karyokinesis (or mitosis) is divided into five stages—prophase, prometaphase, metaphase, anaphase, and telophase.

Interphase, Mitosis (PMAT) and Cytokinesis The regular sequence of growth and division that cells undergo is known as the cell cycle. During the cell cycle, a cell grows, prepares for division, and divides into two new cells, which are called “daughter cells.”

Cytokinesis is the division of the cell's cytoplasm. It begins prior to the end of mitosis in anaphase and completes shortly after telophase/mitosis. At the end of cytokinesis, two genetically

Cytokinesis usually occurs at the end of the cell division cycle, usually close to the start of DNA replication. After mitosis comes cytokinesis, the division of the cytoplasm. This is another process in which animal and plant cells differ.
