Dr Francis Deng and Assoc Prof Frank Gaillard et al. The central base of skull is a region of the skull base centered on the pituitary fossa and includes surrounding structures. Despite no single universally accepted definition of this region, it is frequently used clinically and is conceptually useful particularly when considering tumors of the base of the skull.

The central skull base (CSB) constitutes a frontier between the extracranial head and neck and the middle cranial fossa. The anatomy of this region is complex, containing most of the bony foramina and canals of the skull base traversed by several neurovascular structures that can act as routes of spread for pathologic processes.

Intrinsic Anatomy of the Central Skull Base Sphenoid Bone and Sphenoid Sinus. The sphenoid bone is the principal skeletal underpinning of the central skull base and is architecturally complex. 14 This centrally located body contains the sella turcica above and sphenoid sinus below. There are lateral extensions, the lesser and greater sphenoid wings, and inferior projections, the pterygoid processes, that give rise to the medial and lateral pterygoid plates.

We define the skull base as the region from the upper surface of the ethmoid bone and orbital plate of the frontal bone to the occipital bone. Central to the skull base is the sphenoid bone. The bone itself has the appearance of a bat with its wings extended (Fig. 11-1).

The central skull base is the region from the lesser wing of the sphenoid and planum sphenoidale to the level of the petrous ridge of the temporal bone and the dorsum sellae. The majority of this region is formed by the sphenoid bone with a small a small part of the temporal bone also considered part of the central skull base. (Figure 1) The sphenoid

The skull base is variably defined and comprises several bones, most prominently the sphenoid and temporal bones, with additional involvement of portions of the occipital and frontal bones (Fig. 16.3). 4,? 5,? 6,? 7,? 8 The anterior skull base includes the cribriform plate (consisting of portions of the frontal and ethmoid bones), which is perforated by branches of the olfactory nerve (cranial nerve [CN] I) and roofs

of the orbits (formed from portions of the frontal and sphenoid bones).
