Muscle tissue is specialized to contract, or shorten, which causes movement. There are three types: skeletal (attached to the skeleton), cardiac (forms the heart), and smooth (in the walls of hollow organs). Tissue repair (wound healing) may involve regeneration, fibrosis, or both. In regeneration, the injured tissue is replaced by the same type of cells. In fibrosis, the wound is repaired with scar tissue. Epithelia and connective tissues regenerate well.

View full document. CHAPTER 3: COMPARTMENTATION: CELLS AND TISSUES Compartments are both an advantage and a disadvantage - on the advantage side, compartments separate biochemical process that might conflict with one another o i.e., protein synthesis takes place in one place, while protein degradation takes place in another it also allows, compositions to differ. i.e., lysosome, has an internal pH of 5 which is contained, but if it ruptures, it may kill the cell - disadvantage being o ...
