A large variety of systems exhibit complicated evolution with time; this complicated behaviour is named chaos. Chaos in dynamic systems provides scientists, mathematicians and engineers with the basic tools that they need to have a good grasp of chaotic dynamics and this important frequently-encountered behaviour.

Chaos theory is a branch of mathematics focusing on the study of chaos—states of dynamical systems whose apparently random states of disorder and irregularities are often governed by deterministic laws that are highly sensitive to initial conditions. Chaos theory is an interdisciplinary theory stating that, within the apparent randomness of chaotic complex systems, there are underlying patterns, interconnectedness, constant feedback loops, repetition, self-similarity, fractals, and ...

Dynamical systems theory and chaos. The classical methods of analysis, such as outlined in the previous section on Newton and differential equations, have their limitations. For example, differential equations describing the motion of the solar system do not admit solutions by power series. Ultimately, this is because the dynamics of the solar system is too complicated to be captured by such simple, well-behaved objects as power series.

Chaos in Dynamical Systems - August 2002. In Chapter 3 we have concentrated on geometric aspects of chaos. In particular, we have discussed the fractal dimension characterization of strange attractors and their natural invariant measures, as well as issues concerning phase space dimensionality and embedding.

Even simple nonlinear dynamical systems often exhibit seemingly random behavior that has been called chaos. The branch of dynamical systems that deals with the clean definition and investigation of chaos is called chaos theory. History. The concept of dynamical systems theory has its origins in Newtonian mechanics. There, as in other natural sciences and engineering disciplines, the evolution rule of dynamical systems is given implicitly by a relation that gives the state of the system only ...

Dynamical systems theory - Wikipedia
Hyperbolic systems are precisely defined dynamical systems that exhibit the properties ascribed to chaotic systems. In hyperbolic systems the tangent space perpendicular to a trajectory can be well separated into two parts: one with the points that converge towards the orbit (the stable manifold) and another of the points that diverge from the orbit (the unstable manifold).

In this book we looked at two types of deterministic dynamical systems: iterated functions and differential equations. In both of these types of dynamical systems we encountered chaos: bounded, aperiodic orbits that have sensitive dependence on initial conditions. Chaos is possible in one-dimensional iterated functions but requires three...
