Answer: See answers above. In an electric circuit, the electric potential for a moving charge is gained in the battery and lost in a light bulb (or some resistor found in the external circuit). So the electric potential of a charge is the same for any two points which are not separated by a battery or by a light bulb. (a through d)

Electric current is equal to the number of Coulombs of charge which move past a point on a circuit per unit of time. Electric current provides a measure of how fast charge moves between two points on a circuit. The electric current diminishes in value as charge progresses to locations further and further from the + terminal of the battery. The electric current in a circuit will increase as the electric

Answer: A circuit which is complete in all respect, i.e., its all connections are intact is called a closed circuit. When the switch is on, the current flows in it and the bulb glows (Fig. 12.22a). On the other hand, a circuit is called open or not complete (Fig. 12.22b), when connections are not intact, i.e., broken.

Lesson 6-4 Review. 1. [0.56 A]—You should recall that in a series circuit, there is only one value for current, as shown in the formula  $I_s = I_1 = I_2 = \dots I_x$ . If we find the total current, that will be equal to the current through the  $5.0\Omega$  resistor. First, we will find the total resistance.  $R_s = R_1 + R_2 + R_3 = 2.0\Omega + 5.0\Omega + 9.0\Omega = 16.0\Omega$
