Solution concentration worksheet Common way to express a solution concentration is molarity (M). Molarity is the amount of solute (in moles) divided by the volume of solution (in liters). The molarity of a solution can be used as a conversion factor between moles of the solute and liters of the solution. For example: A 0.500 M NaCl

Stoichiometry in chemistry is a way to account for the masses of substances going into and coming out of a chemical reaction. It involves being fluid in transforming from moles to grams and grams to moles. You will need to be effective at unit analysis to be able to do this.

moles of solute per liters of solution. The units for molarity are written as mol/L or M. This measurement is used to perform stoichiometric calculations. The strategy used for solving these solution stoichiometry problems is to set up the problem so that the units cancel.
