The periodic table helps predict some properties of the elements compared to each other. Atom size decreases as you move from left to right across the table and increases as you move down a column. The energy required to remove an electron from an atom increases as you move from left to right and decreases as you move down a column.

The periodic table displays the pattern of properties of the elements. The lightest are at the top of the chart; the atomic masses increase toward the bottom of the chart. The elements to the upper right, above a diagonal line from aluminum (13) to polonium (84), are nonmetals, about half of which exist as gases under normal laboratory conditions.

The periodic table is organized such that elements are arranged in order of increasing numbers of protons. In fact, there are all sorts of what scientists call "trends" in the organization of the periodic table. These are not fashion trends like boot cut or skinny jeans. The elements are always in fashion when it comes to chemistry. (Corny, we know.)

Horizontal rows of the periodic table are called periods. Horizontal rows of the periodic table are called periods. Even though some boxes appear to be missing, all of the rows go left to right, skipping over any blank areas. Every element in the same period has the same number of atomic orbitals. These orbitals (s, p, d, and f) are the area around an atom where its electrons are most likely to be found.
