Abstract. We survey some recent developments in the study of the complexity of certain lattice problems. We focus on the recent progress on complexity results of intractability. We will discuss Ajtai ' s worst-case/average-case connections for the shortest vector problem, similar results for the closest vector problem and short basis problem, NP-hardness and non-NP-hardness, transference theorems between primal and dual lattices, and application to secure cryptography.

May 21, 2007. Abstract Lattice problems are known to be hard to approximate to within sub-polynomial factors. For larger approximation factors, such as  $p \cdot n$ , lattice problems are known to be in complexity classes such as NP /coNP and are hence unlikely to be NP-hard. Here we survey known results in this area.

However, before lattice cryptography goes live, we need major advances in understanding the hardness of lattice problems that underlie the security of these cryptosystems. Significant, groundbreaking progress on these questions requires a concerted effort by researchers from many areas: (algebraic) number theory, (quantum) algorithms, optimization, cryptography, and coding theory.
