Consistent Estimation Of Real Econometric Models With ...
Abstract The primary concern is to establish a fairly general
framework in which estimators resulting from estimating
equations $g_n = 0$ are not consistent. This leads on to
consistency by an intuitive route. Asymptotic distributions
of consistent estimators are also touched upon, and the
results are applied to various examples.

An estimator is consistent if, as the sample size increases, the estimates (produced by the estimator) "converge" to the true value of the parameter being estimated. To be slightly more precise - consistency means that, as the sample size increases, the sampling distribution of the estimator becomes increasingly concentrated at the true parameter value.

Econometrics is the application of statistical methods to economic data in order to give empirical content to economic relationships. More precisely, it is "the quantitative analysis of actual economic phenomena based on the concurrent development of theory and observation, related by appropriate methods of inference". An introductory economics textbook describes econometrics as allowing economists "to sift through mountains of data to extract simple relationships". The first known use of the te
