Control Valves for Chemical Reactions Because the use of chemicals, especially hazardous ones, is such a precise process, the control valve must often perform to exacting standards. They are generally controlled electronically, hydraulically, pneumatically, and even in some cases, manually by trained operators.

Proportional Control Valve:
The flow rate is controlled by an automatic proportional action based on the signal received by the controller. The valves which can be used are ball valve, globe valve, etc. On-Off Valve: The valve is either fully close or fully open. The valves which can be used are gate valve,

Conduit type gate valve is common in chemical process industries because it gives accurate flow control. Gate valve can be used upto 20 kg/cm² and upto 675°C.

Material of construction for gate valve is cast iron, carbon steel, stainless steel, ductile iron, bronze, nickel alloys etc. Rotating disc type gate valve with quick action lever actuator.

critical part of the control loop. The control valve manipulates a flowing fluid, such as gas, steam, water, or chemical compounds to compensate for the load disturbance and keeps the regulated process variable as close as possible to the desired set point. Best-in-class research & engineering means verified solutions you can trust.

Flapstopper - Pollution Control Valve

The control valve manipulates a flowing fluid, such as gas, steam, water, or chemical compounds, to compensate for the load disturbance and keep the regulated process variable as close as possible to the desired set point. Control valves may be the most important, but sometimes the most neglected, part of a control loop.
