Cow's Eye Dissection Prac Report by Emillie Neil

Cow Eye Dissection Introduction: The eye is a special sensory organ with a complex structure and function. The objective was to gain a better understanding of the structure and the function of the eye. In this lab, we set out to dissect a cow's eye and identify the different parts of the eye. We did this by removing the fat and muscle surrounding the eye to reveal the sclera, and be able to make an incision in the middle of the eye to reveal the inner parts of the eye; the vitreous humor, ...

Dissection Lab Report 2. Abstract □ The purpose of this experiment is to better understand the anatomical structures of the nervous system. □ The sheep brain and cow eye are used because they are the structures that are most closely related to the human brain and eye. □ The anatomy of these structures would not mean anything if they were not correlated with functions.

1. Place the cow eye on a dissecting tray. The eye most likely has a thick covering of fat and muscle tissue. Carefully cut away the fat and the muscle. As you get closer to the actual eyeball, you may notice muscles that are attached directly to the sclera and along the optic nerve. These are the extrinsic muscles that allow a cow to move its eye up and down and from side to side. Keep cutting close to the sclera, separating the membrane that attaches the muscle to it.
