Secondly, even within a single deformation, mechanisms and microstructures vary from mineral to mineral within a polymineralic rock: a common example is the intracrystalline plasticity of quartz in a shear zone at greenschist facies, that contrasts with cataclastic deformation of feldspar in the same conditions.

Deformation mechanisms and microstructures. When strain accumulates in a deforming rock, certain deformation processes occur at the micro-scale that allow the rock to change its internal structure, shape or volume. The processes involved may vary and in the plastic regime there are other and different processes.

Deformation mechanism refers to the various processes occurring at micro-scale that are responsible for changes in a material's internal structure, shape and volume. The process involves planar discontinuity and/or displacement of atoms from their original position within the crystal lattice system. These small changes are preserved in various microstructures of materials such as rocks, metals ...

6. Microstructural mechanisms of fatigue crack initiation in low and high cycle fatigues. The sequence of cyclic deformation events sketched in figure 2 is typical of ductile metals and alloys. In cyclic saturation, a characteristic dislocation structure has developed in the bulk, and a pattern of slip traces or some sort of PSBs of highly localized slip is recognizable at the surface.

We use detailed EBSD measurements to reconstruct microstructures that constrain the relative contribution of specific deformation mechanisms operating in different parts of an active salt fountain. In particular, we contrast the microstructures and interpreted mechanisms from the top of the extruded glaciers and the diapiric stem.

Here are some deformation maps for common minerals. (Davis & Reynolds Fig. 4.61) VDPM 09.34. VDPM 09.35. VDPM 09.36. These maps show the fastest deformation mechanism under given conditions of T and differential stress. Contours are drawn within the diagrams showing the strain rate predicted under those given conditions.

Deformation microstructure not only determines the properties of a deformed metal but also provides the driving force for recovery and recrystallization; recovery competes with recrystallization in restoring microstructure and properties and at the same time facilitates nucleation of recrystallization.
