For second order differential equations, which will be looking at pretty much exclusively here, any of the following can, and will, be used for boundary conditions.

$$y(x_0) = y_0 \quad y(x_1) = y_1. \quad y'(x_0) = y'_0 \quad y'(x_1) = y'_1$$
$$y''(x_0) = y''_0 \quad y''(x_1) = y''_1 \quad y'''(x_0) = y'''_0 \quad y'''(x_1) = y'''_1$$

Differential Equations with Boundary-Value Problems. This edition of the expanded version of Zill's "A First Course in Differential Equations with Modeling Applications", places greater emphasis on modelling and the use of technology in problem solving and features more everyday applications. Both Zill texts are identical through the first nine chapters, but this version includes six, additional chapters that provide in-depth coverage of boundary-value problem-solving and partial ...

In mathematics, in the field of differential equations, a boundary value problem is a differential equation together with a set of additional constraints, called the boundary conditions. A solution to a boundary value problem is a solution to the differential equation which also satisfies the boundary conditions. Boundary value problems arise in several branches of physics as any physical differential equation will have them. Problems involving the wave equation, such as the determination of nor

The first topic, boundary value problems, occur in pretty much every partial differential equation. The second topic, Fourier series, is what makes one of the basic solution techniques work.

boundary conditions is called a boundary-value problem (BVP). Boundary conditions come in many forms. For example, $y(6) = y(22)$; $y_0(7) = 3y(0)$; $y(9) = 5$ are all examples of boundary conditions. Boundary-value problems, like the one in the example, where the boundary condition consists of specifying the value of the solution at some point are ...
