There are two major changes in the Fourth Edition of Differential Equations and Their Applications. The first concerns the computer programs in this text. In keeping with recent trends in computer science, we have replaced all the APL programs with Pascal and C programs. The Pascal programs appear in the text in place of the APL programs, where they are followed by the Fortran programs, while the C programs appear in Appendix C.

There are three major changes in the Third Edition of Differential Equations and Their Applications. First, we have completely rewritten the section on singular solutions of differential equations. A new section, 2.8.1, dealing with Euler equations has been added, and this section is used to motivate a greatly expanded treatment of singular equations in sections 2.8.2 and 2.8.3.

Aims and scope. 'Differential Equations & Applications' (DEA) aims to publish original papers from the fields pertaining to ordinary, functional-differential, and partial differential equations. Only papers of the highest quality will be accepted for publication. The papers which demonstrate novelty, establish relations of differential equations with other fields of mathematics or examine a variety of applications of differential equations are particularly welcome.

is a function of x alone, the differential equation has \dots as an integrating factor. After multiplying through by $y = x^2$, the differential equation describing the desired family of orthogonal trajectories becomes \dots which is now exact (because $M_y = 2x^2y = N_x$). Since \dots and \dots the solution of the differential equation is

In mathematics, a differential equation is an equation that relates one or more functions and their derivatives. In applications, the functions generally represent physical quantities, the derivatives represent their rates of change, and the differential equation defines a relationship between the two.

In mathematics, differential calculus is a subfield of calculus that studies the rates at which quantities change. It is one of the two traditional divisions of calculus—the other being integral calculus—the study of the area beneath a curve.. The primary objects of study in differential calculus are the derivative of a function, related notions such as the differential, and their applications.
