Digital signal processing is the use of digital processing, such as by computers or more specialized digital signal processors, to perform a wide variety of signal processing operations. The digital signals processed in this manner are a sequence of numbers that represent samples of a continuous variable in a domain such as time, space, or frequency. In digital electronics, a digital signal is represented as a pulse train, which is typically generated by the switching of a transistor. Digital si

It is not normally appreciated that the development of digital signal processing began because designers of analog signal processing systems wished to simulate their performance before building expensive prototypes. The obvious tool to perform the simulations on was the digital computer and thus began the development of digital signal processing.

Digital Signal Processing: Principles, Algorithms and ...

In digital signal processing the processes that were achieved using hardware are done using software. In order to process signal variables that are continuous with time using software the variables have to be converted to the correct for- mat; normally a sequence of numbers. This is done using analog to digital converters.
