remainder has degree that is strictly less than the degree of the polynomial we're dividing by, $(x + 2)$ in this case. The polynomial we're dividing by has degree one and so, in this case, we'll stop when the remainder is degree zero, i.e. a constant. Here is the long division work for this problem.

Divide Polynomials

Using Long Division.

Divide a polynomial by
a binomial, we follow a
procedure very similar

to long division of numbers. So let's look carefully the steps we take when we divide a 3-digit number, 875, by a 2-digit number, 25.

We check division by multiplying the quotient by the divisor.

In the case of the above polynomial division, the zero remainder tells us that $x + 1$ is a factor of $x^2 - 9x - 10$, which you can confirm by factoring the original quadratic dividend, $x^2 - 9x - 10$.
