DNA computing, the performing of computations using biological molecules, rather than traditional silicon chips. The idea that individual molecules (or even atoms) could be used for computation dates to 1959, when American physicist Richard Feynman presented his ideas on nanotechnology.

The goal of the DNA computing field is to create a device that can work independent of human involvement. Three years after Adleman's experiment, researchers at the University of Rochester developed logic gates made of DNA. Logic gates are a vital part of how your computer carries out functions that you command it to do.

### [How DNA Computers Will Work | HowStuffWorks](#)

DNA computing is a novel method that solving a class of intractable computational problems, in which the computing speeds up exponentially with the problem size. Up to now, many accomplishments have been made to improve its performance and increase its reliability.

Basics And Origin of DNA Computing. DNA computing is utilizing the property of DNA for massively parallel computation. With an appropriate setup and enough DNA, one can potentially solve huge problems by parallel search. Utilizing DNA for this type of computation can be much faster than utilizing a conventional computer

## DNA Computing

DNA computing is a branch of computing which uses DNA, biochemistry, and molecular biology hardware, instead of the traditional silicon-based computer technologies. Research and development in this area concerns theory, experiments,

As being a new theory, the DNA computing treated as a new computational pattern also need a lot of basic theoretical research system. This article describes the nature of DNA computing, given the equivalence of DNA computing pattern with traditional computer under the support of automata theory system, further analysis and understanding the DNA computing pattern.

DNA computing is the use of biomolecular components rather than standard artificial hardware (such as silicon chips) in computer technology. In place of traditional code (such as the common binary variety), DNA computing utilizes the four-character genetic alphabet, which consists of: A □ Adenine; G □ Guanine; C □ Cytosine; T □ Thymine

### What is DNA Computing? - Definition from Techopedia

DNA computing technology is unlikely to replace conventional silicon computers. But within five to 10 years DNA-based computers could be tested for medical applications.

DNA computing is an emerging branch of computing which uses DNA, biochemistry, and molecular biology hardware, instead of the traditional silicon-based computer technologies. Research and development in this area concerns theory, experiments, and applications of DNA computing. Although the field originally started with the demonstration of a computing application by Len Adleman in 1994, it has now been expanded to several other avenues such as the development of storage technologies, nanoscale i
