regulate the stemness, cell invasion and EMT via Hh pathway, and decreased USP37 confers sensitivity to cisplatin in breast cancer cells.

---

USP37 ubiquitin specific peptidase 37 [ (human)]

USP37 (Ubiquitin Specific Peptidase 37) is a Protein Coding gene. Diseases associated with USP37 include External Ear Disease. Among its related pathways are Metabolism of proteins and Deubiquitination. Gene Ontology (GO) annotations related to this gene include protein kinase binding and thiol-dependent ubiquitin-specific protease activity.

USP37 is commonly overexpressed in breast cancer. USP37 has been previously confirmed to be overexpressed in lung cancers cells and tissues [].In order to investigate the role of USP37 in tumorigenesis, we examined the breast cancer database of The Cancer Genome Atlas (TCGA) to evaluate the differential expression of USP37 [].Analysis of the TCGA database indicated that cancer with USP37 ...

Abnormally elevated USP37 expression in breast cancer stem ...  
Functionally, USP37 regulates cell proliferation and the Warburg effect by regulating c-Myc levels. Clinically, USP37 is significantly upregulated in human lung cancer tissues, where its expression is positively correlated with c-Myc protein expression.

---

USP37 directly deubiquitinates and stabilizes c-Myc in ...  
In this study, we identified USP37 as a HIF2? deubiquitinase that can bind with and promote HIF2? protein stability. As a result, loss of USP37 can decrease ccRCC cell proliferation as well as ccRCC tumor growth in an orthotopic xenograft model. Our results suggest that USP37 is a potential therapeutic target in ccRCC.

---

USP37 promotes deubiquitination of HIF2? in kidney cancer ...  
USP37 overexpression caused premature cyclin A accumulation in G1 and accelerated S phase entry, whereas USP37 knockdown delayed these events. USP37 was inactive in mitosis because it was no longer phosphorylated by CDK2. Indeed, it switched from an antagonist to a substrate of APC CDH1 and was modified with degradative K11-linked polyubiquitin.

---

Deubiquitinase USP37 Is Activated by CDK2 to Antagonize ...  
USP37 regulated the ability of cell invasion, epithelial-mesenchymal transition (EMT), stemness and cisplatin sensitivity in breast cancer cell lines. Additionally, USP37 knockdown inhibited tumorigenicity and increased anticancer effect of cisplatin in vivo. Knockdown of USP37 significantly decreased hedgehog (Hh) pathway components Smo and Gli-1.

Compendial Approvals for USP37-NF32 2S

Members here include USP37, USP29, and USP26. All of these contain a single PH-like domain. USP37 (also called ubiquitin carboxyl-terminal hydrolase 37, ubiquitin thiolesterase 37, deubiquitinating enzyme 37, and tmp\_locus\_50) is a deubiquitinase that antagonizes the anaphase-promoting complex (APC/C) during G1/S transition by mediating deubiquitination of cyclin-A (CCNA1 and CCNA2), resulting ...

CDD Conserved Protein Domain Family: PH\_USP37\_like

USP37 is co-localized with Snail in the nucleus. Biologically, upregulated expression of USP37 promotes lung cancer cell migration, while depletion of Snail abolishes the effect of USP37. These data demonstrate that USP37 is a Snail-specific deubiquitinase and also indicate a potential therapeutic target for metastasis.

USP37 Antibody Gene and Protein Information Ubiquitin (Ub) is a highly conserved protein found ubiquitously in eukaryotic organisms. The conjugation of ubiquitin to proteins is an important means to regulate protein activity for many cellular processes by tagging them for degradation.
