integrity accordingly.

Since the EDM discharge produces the white layer

## EDM Effect on Surface Integrity

The on-time is well known as having a direct effect on the surface finish of the cavity as longer on-times result in a rougher cavity finish than shorter on-times.

Regardless of the voltage

affects the long-term durability and performance of seals acting on the surface.

With EDM there is no “ lay ” and EDM finish quality can be mirror-like. Erosion rather than cutting. EDM works by creating arcs of electricity between the tool and workpiece.

The aerospace industry discovered the EDM process damaged the surface of the components being machined. This damage was a result of the heat generated by the EDM process, and consisted of the recast layer, or white layer, and an annealed Heat Affected Zone (HAZ), which lay directly below the hard

What is its effect on  
surface integrity? During  
EDM each individual  
spark vaporises, then  
melts, a small amount of  
material and leaves a  
crater in the work-piece.  
This is consistent in both  
wire or spark EDM  
applications.
