An electric power system is a network of electrical components deployed to supply, transfer, and use electric power. An example of a power system is the electrical grid that provides power to homes and industry within an extended area. The electrical grid can be broadly divided into the generators that supply

We divide the power system into three parts; power generation, transmission and distribution. In this article, we will discuss power generation. Actually, in power generation, one form of energy gets converted into electrical energy. We produce electrical energy from various natural sources. We classify these sources into two types renewable...

P is for power measured in Watts, I is for current and the E is for voltage. This equation can be combined with Ohm's law to solve for values that are unknown. For example: In Ohms law we know that $I = E/R$ so combined with the power equation ($P = IE$) we get $P = E (E/R)$ or $P = E^2/R$.
