The oil and gas industry is largely run on electricity generated on site using gas turbines and currently accounts for approximately one quarter of Norway's total carbon emissions. Troll A was the first platform on the Norwegian continental shelf to be electrified, back in 1996. The Gjøa field was electrified from the very outset.

In traditional wells, hydraulic fluid flows from a facility above the surface of the water into a subsea well through specialised pipes, which is used to power the well's hydraulic equipment, which pumps the oil back to the surface. By electrifying the system, high-pressure equipment such as the hydraulic pipes are removed, reducing the risk of explosions arising from faulty pipes, and eliminates the threat of a pipe leaking, and spilling hydraulic fluid into the surrounding ocean.
