An emerging infectious disease (EID) is an infectious disease whose incidence has increased recently (in the past 20 years), and could increase in the near future. Such diseases do not respect national boundaries. The minority that are capable of developing efficient transmission between humans can become major public and global concerns as potential causes of epidemics or pandemics.

The emergence of fungi, such as *Aspergillus* spp., and other opportunistic agents that were previously uncommon or unrecognized as human pathogens is related primarily to an increase in infection-susceptible populations, such as those having undergone cancer chemotherapy, organ and tissue transplantation, or having become infected with HIV (Dixon et al., 1996). In some oncology and transplant hospital units more than 10 percent of patients are colonized or infected with vancomycin-resistant ...
