A regular oilfield emulsion is a dispersion of water droplets in oil. Emulsions can be difficult to treat and may cause several operational problems in wet-crude handling facilities and gas/oil separating plants. Emulsions can create high-pressure drops in flow lines, lead to an increase in demulsifier use, and sometimes cause trips or upsets ...

Other equipment to minimize droplet size will improve the stability of an emulsion. When naming the emulsion type, the first letter is the discontinuous phase. O/W stands for oil-in-water and is classified as an emulsion. W/O stands for water-in-oil and is classified as an invert emulsion.
