A turbocharger comprises a gas turbine driven by the engine exhaust gases mounted on the same spindle as a blower, with the power generated in the turbine equal to that required by the compressor. From: Pounder's Marine Diesel Engines and Gas Turbines (Ninth Edition), 2009

is based on the principle of momentum conservation. Part of the enthalpy (energy) of the exhaust gases is converted by the turbine into mechanical energy used to drive the compressor. The rotation of the compressor will draw air from the atmosphere and compress it before going into the engine.

A turbocharger, colloquially known as a turbo, is a turbine-driven, forced induction device that increases an internal combustion engine's efficiency and power output by forcing extra compressed air into the combustion chamber. This improvement over a naturally aspirated engine's power output is because the compressor can force more air—and proportionately more fuel—into the combustion ...
