The workbook uses the Coolprop Excel add-in to compute thermophysical properties of a baker's dozen of fluids. The user can then plot the saturated liquid and saturated vapor lines in one of four common formats: (1) Temperature - entropy, (2) Pressure - volume, (3) Temperature - volume and (4) enthalpy - entropy (Mollier diagram).

Tables are presented for the thermodynamic properties of air from 90 to 15000K using (1) temperature and pressure and (2) temperature and density as independent variables. The pressure tables range from 1 to 1200 atmospheres, whereas the density tables extend from 10⁻⁷ to 400 relative atmospheres (or amagat units).

Thermodynamic databases contain information about thermodynamic properties for substances, the most important being enthalpy, entropy, and Gibbs free energy. Numerical values of these thermodynamic properties are collected as tables or are calculated from thermodynamic datafiles. Data is expressed as temperature-dependent values for one mole of substance at the standard pressure of 101.325 kPa, or 100 kPa. Unfortunately, both of these definitions for the standard condition for pressure are in use
