The fact that one can fit a PWE survival model using a generalised linear model (i.e. a Poisson regression model) has important consequences for fitting multilevel survival models. First, one can incorporate cluster-specific random intercepts to incorporate within-cluster homogeneity in outcomes. As with HLMs and HGLMs, one is not restricted to a two-level data hierarchy, with only one ...

Multilevel modeling can also be applied to repeated measures designs (see the first paragraph of the conclusion). For instance, if participants are primed with pictures, using such an approach will enable advanced users to take both between-stimuli and between-participant variations into account (Judd, Westfall & Kenny, 2012).

A more sophisticated approach is an extension of standard regression known as multilevel modelling (MLM). MLM exploits the full data structure; therefore no information on the lower level is lost. Furthermore, as MLM explicitly models the hierarchy, it yields correctly specified estimates of the SEs and both Type I and II error rates.
