DESCRIPTION. Adjust the hills on a toy-car roller coaster and watch what happens as the car careens toward an egg (that can be broken) at the end of the track. The heights of three hills can be manipulated, along with the mass of the car and the friction of the track. A graph of various variables of motion can be viewed as the car travels, including position, speed, acceleration, potential energy, kinetic energy, and total energy.

Kurt holds a Master of Science in Geology from the University of Cincinnati, and a bachelor's degree in Earth Science from Harvard. He taught high school and middle school science for eight years before joining Explore Learning in 2005. A while ago, a teacher named Joshua Buchman suggested a way to improve our popular Roller Coas ter Physics Gizmo. In the Gizmo, a toy car rolls down a track, over several hills, and into an egg.

Are you or your students planning a summer trip to an amusement park? Take advantage of this teachable moment with the Roller Coaster Physics Gizmo. The Gizmo demonstrates how potential energy is converted to kinetic energy (and vice versa) as a toy car moves over a series of hills before crashing into an egg. This is similar to how the potential energy of a roller coaster car is converted to kinetic energy as it rolls over hills and around loops.
