Common design practice is to use a nominal edge distance of $2 D$ from the fastener hole centerline, where D is the fastener diameter. The minimum edge distance should not be less than $1.5 D$. The nominal distance between fasteners is $4 D$, but the thickness of the materials being joined can be a significant factor.

A practical starting point for all threaded fastener tightening analysis is to use the basic elastic torque-tension equation, $T = K \cdot D \cdot F$, to estimate the relative magnitudes of torque and clamp force. Starting with this equation, which defines a linear relationship between torque and tension, you can develop models for the tightening process.

~~A designer's guide to the specification
of fasteners~~

“Thread- forming, high- low, thread-
cutting, and self- tapping screws are
four common threaded fasteners used
in plastics.” Design engineers are often
challenged to find the right type of
fastener for the right application. Two
of the biggest challenges are lack of
experience and information.
