Control valve flow is a function of both the pressure drop across the valve and the valve travel. In control valve selection, pressure drop plays a role in determining not only the valve and trim style, but the materials of construction as well. Higher pressure drops generally require highly engineered control valves for good performance.

A control valve is comprised of an actuator mechanism that is capable of changing the position of flow controlling element in the valve. The valve modulates flow through movement of a valve plug in relation to the port(s) located within the valve body. The valve plug is attached to a valve stem, which, in turn, is connected to the actuator.
