Abstract. A food allergen has the ability to first elicit an immunoglobulin E (IgE) response, and then, on subsequent exposures, to elicit a clinical response to the same or similar protein. However, despite increasing knowledge of the structure and amino acid sequences of the identified allergens, only a few biochemical characteristics can be associated with food allergens, such as the biochemical characteristics that allow a food protein to survive the extremes of food processing, escape ...

Some biochemical characteristics associated with food allergens, such as the presence of multiple, linear IgE-binding epitopes and the resistance of the protein to digestion and processing, seem to predominate among food allergens. Digestion susceptibility of food allergens that sensitize via the gastrointestinal tract and stability to food processing conditions are inherently related to protein structural features.
