Force can also be described intuitively as a push or a pull. A force has both magnitude and direction, making it a vector quantity. It is measured in the SI unit of newtons and represented by the symbol F . The original form of Newton's second law states that the net force acting upon an object is equal to the rate at which its momentum changes with time.

Force Closure. Although form closure provides stability to the SIJ, for mobility to occur further joint compression and stabilisation is required to withstand a vertical load . Force closure is the term used to describe the other forces acting across the joint to create stability. This force is generated by structures with a fibre direction perpendicular to the sacroiliac joint and is adjustable according to the loading situation.

The entrepreneurial form tends to occur when the force for direction dominates an organization, so that the chief executive takes personal control of much of what goes on. This happens especially in startup and turnaround situations, both of which require the imposition of strong vision from the top; it also happens in small, owner-managed ...

The Effective Organization: Forces and Forms

The principles of form and force closure were introduced to describe the complex mechanism of sacroiliac joint (SIJ) stability. Form closure refers to a theoretical stable state of a joint with close fitting articular surfaces, where no extra forces are needed to maintain the stable state of the system during loading and unloading situations.
