One basic concept is that for the automatic feedback control to exist, the automatic control loop must be closed. This means that information must be continuously passed around the loop. The controller must be able to move the valve, the valve must be able to affect the measurement, and the measurement signal must be reported to the controller.

Automatic Control System - an overview | ScienceDirect Topics
Automation » Automatic Control Technology. Automatic control technology is a wide generic term covering the operation and regulation of processes without continuous direct human intervention and this laboratory has been designed to introduce the fundamentals. The end user has the possibility to perform the control of variables such as temperature, light, level, flow and DC motor in different ways as PID, open-loop, closed-loop, continuous and discontinuous.

Fundamentals of Automatic Control - VVG.hr

According to DIN 19223, an automatic machine is an artificial system that makes decisions based on the linking of inputs with the respective states of the system. These decisions then produce very specific desired outputs. Three components are needed to realise modern automatic processes: Sensors to detect the system states,

ABSTRACT. Automatic generation control (AGC) is one of the most important control problems in the design and operation of interconnected power systems. Its significance continues to grow as a result of several factors: the changing structure and increasing size, complexity, and functionality of power systems, the rapid emergence (and uncertainty) of renewable energy sources,

The primary purpose of automatic climate control is to manage the temperature of a given area for the comfort of onboard passengers. HVAC was first introduced into automobiles in the early 1960s, and is available in most of the high-end vehicles today. It is a complex system consisting of mechanical/electronic switches or knobs in the frontend.
