If $0 < s < \text{ord}(a)$, then the minimality of $\text{ord}(a)$ is contradicted. If $s > \text{ord}(a)$ then $s = q \cdot \text{ord}(a) - r$, where $0 < r < \text{ord}(a)$, and as — 22 CODES, GRAPHS, AND ITERATIVE DECODING $aq - \text{ord}(a)r = ar - r$ must be zero-otherwise, the minimality of $\text{ord}(a)$ is again contradicted. Now let $\text{ord}(a) = x$.

This paper develops a fundamental theory of realizations of linear and group codes on general graphs using elementary group theory, including basic group duality theory. Principal new and extended results include: normal realization duality; analysis of systems-theoretic properties of fragments of realizations and their connections; "minimal = trim and proper" theorem for cycle-free codes; results showing that all constraint codes except interface nodes may be assumed to be trim and proper ...

Since we can represent our code and how it behaves with respect to either runtime or memory space on a Cartesian Graph, it follows that there must be functions which describe how to draw such a graph. The way in which we describe how efficient our code in this way is to use "Big O" notation.
