Generative Geometric Design And Boundary

Generative geometric design and boundary solid grammars Abstract: "This proposal introduces boundary solid grammars, a formalism for generating complex models of rigid solid objects. Solids are represented by their boundary elements, i.e. vertices, edges and facts, with coordinate geometry associated with the vertices.

Generative geometric design and boundary solid grammars

Generative geometric design. Abstract: Boundary solid grammars use design rules that express complex geometric conditions and operations using a logical reasoning mechanism, allowing one to construct powerful rules and describe appropriate grammars for the generation of solid models for a variety of design domains. Generative Geometric Design And Boundary Solid Grammars

The boundary solid grammar formalism is, however, well suited to extensions for the representation of nonlinear geometry and mixed-dimensional modeling. Design in these domains will require additional representations, such as electrical and hydraulic schematics, structural and aerodynamic meshes, kinematics, and assemblies.

The formalism I present in this article is not sufficient for all engineering and architectural domains (e.g., polyhedral solids are not adequate geometric abstractions for mechanical design). The boundary solid grammar formalism is, however, well suited to extensions for the representation of nonlinear geometry and mixed-dimensional modeling.

"Generative design" is an umbrella term used to describe a variety of new CAD tools which are all engineered to optimize manufacturability, lightweight products and save on material usage. The end results can often be organic, alien-looking Giger-esque parts that save energy from machining operations.
