Icebergs float in salt water because they are formed by calving, or splitting, glaciers and are thus made of fresh water. The size of icebergs varies widely. Small bergs (a little smaller than a car) are known as "growlers," while slightly larger bergs (about the size of a house) are called "berg bits."

Beyond ...~~

Icebergs float in the ocean, but are made of frozen freshwater, not saltwater. Most icebergs in the Northern Hemisphere break off from glaciers in Greenland. Sometimes they drift south with currents into the North Atlantic Ocean. Icebergs also calve from glaciers in Alaska.

Glaciers are located in the Arctic and Antarctica, with the largest glaciers appearing in Antarctica. Icebergs, on the other hand, are smaller pieces of ice that have broken off (or calved) from glaciers and now drift with the ocean currents. Icebergs calve from glaciers when direct sunlight or rising air temperature cause the glacier's surface ice to become more brittle.

Iceberg, floating mass of freshwater ice that has broken from the seaward end of either a glacier or an ice shelf. Icebergs are found in the oceans surrounding Antarctica, in the seas of the Arctic and subarctic, in Arctic fjords, and in lakes fed by glaciers.

Icebergs are chunks of glacial ice that break off glaciers and fall into the ocean. When glaciers melt, because that water is stored on land, the runoff significantly increases

An iceberg is a large piece of freshwater ice that has broken off a glacier or an ice shelf and is floating freely in open water. Small bits of disintegrating icebergs are called "growlers" or "bergy bits". Much of an iceberg is below the surface which led to the expression "tip of the iceberg" to illustrate a small part of a larger unseen issue. Icebergs are considered a serious maritime

~~Iceberg~~ ~~Wikipedia~~

Icebergs are floating all around Antarctica. They calve off from tidewater glaciers or ice shelves. They can range in size from small chunks you could fit into a gin and tonic to huge floating behemoths that take decades to melt and that you can land a helicopter on.

A blue iceberg is visible after the ice from above the water melts, causing the smooth portion of ice from below the water to overturn. The rare blue ice is formed from the compression of pure snow, which then develops into glacial ice. Icebergs may also appear blue due to light refraction and age. Older icebergs reveal vivid hues of green and blue, resulting from a high concentration of color, microorganisms, and compacted ice. One of the better known blue icebergs rests in the waters off Sermi

Icebergs and glaciers are both enormous masses of snow, built up over the years through natural processes. However, they are both different from each other in form and structure, as well process of formation. Glaciers are formed by continual deposition of snow at a place where it does not melt.

Petermann Glacier (Danish: Petermann Gletsjer) is a large glacier located in North-West Greenland to the east of Nares Strait. It connects the Greenland ice sheet to the Arctic Ocean at 81°10' north latitude, near Hans Island.. The glacier and its fjord are named after German cartographer August Heinrich Petermann.

~~Icebergs & Glaciers — HarperCollins~~

Due to rising atmospheric and ocean temperatures, the balance between glacier melting and replenishment, as well as iceberg calving, is changing. Over time, a glacier's front may naturally advance or retreat, but the new research shows that none of the 225 ocean-terminating glaciers surveyed has substantially advanced since 2000, while 200 have retreated.
