The inertial control has a substantial impact on system performance. The short term impact is the delivery of extra power from WT with substantially reducing the ROCOF, providing time for the active governors to respond (see Fig. 8).

Based on the proposed technique, the dynamic effect of inertia emulated by storage devices for frequency and active power control are evaluated. The effects of frequency measurement delay and phase-locked loop effect are also considered by introducing a second-order function.

Simulations performed by MATLAB software demonstrate how virtual inertia emulation can effectively improve the performance of the power system.
