What I'm looking for here is to understand why someone would, or would not, implement a high-density environment. What are the pros and cons of a high-density environment? At what point should someone consider implementing a high-density environment? From what I can see, the initial pros are: More complete use of server resources Able to run a process in parallel on a single server instance ...

How does HDBSCAN do this? At a high level, we can simplify the process of density-based clustering into these steps: Estimate the densities; Pick regions of high density; Combine points in these selected regions; Estimating densities. We need some method to estimate the density around certain points. One common way to do this is by using "core distance."
