< Introduction to Astrophysics A Black Hole is a theoretical object in physics in which gravity's pull is so strong that nothing can escape. The idea of a black hole comes from the idea that there is a universal speed limit, the speed of light. This creates an anomaly which we call an event horizon.

physics and astrophysics are reviewed. 1. Introduction Strictly speaking, black holes do not exist. Moreover, holes, of any kind, do not exist. You can talk about holes of course. For instance you can say: “there is a hole in the wall”. You can give many details of the hole: it is big, it is round shaped, light comes in through it. Even, perhaps, the hole could be such that

Galactic Bars: Feeding a Galaxy's Nuclear Black Hole

Black holes are one of the most fascinating predictions of general relativity and are currently a very hot topic in both physics and astrophysics. In the last five years there have been significant advances in our understanding of these systems, and in the next five years it should become possible to use them to test fundamental physics, in particular to predict the general relativity in the strong field regime.

Astrophysics of Black Holes / SpringerLink

In introducing black holes, Professor Bailyn offers a definition, talks about how their existence is detected, and explains why (unlike in the case with exoplanets where Newtonian physics was applied) Einstein’s Theory of Relativity is now required when studying black holes. The concepts of escape and circular velocity are introduced.

ASTR 160 - Lecture 8 - Introduction to Black Holes / Open ...

The simplest definition of a black hole is an object that is so dense that not even light can escape its surface. But how does that happen? The concept of a black hole can be understood by thinking about how fast something needs to move to escape the gravity of another object – this is called the escape
