Description. Introduction to Magnetochemistry provides an introduction to the more important aspects of magnetochemistry. The measurement of magnetic moment has been one of the most consistently useful to coordination chemists. For teaching purposes it provides a simple method of illustrating the ideas of electronic structure, and in research it can provide fundamental information about the bonding and stereochemistry of complexes.

The molar susceptibility  $\chi_m$  is obtained by multiplying with the molar  $f_2$  I. Diamagnetism and Paramagnet–sm volume,  $v$  (in  $\text{cm}^3/\text{mol}$ ). So, the molar susceptibility leads to  $M = H z N / v$  , or ; $\mu = \chi N H$ , where  $M v$  is now the magnetic moment per mol. The dimension ofmolar susceptibility is thus  $\text{emu}/\text{mol}$  or  $\text{cm}^3/\text{mol}$ .
