What is Calculus of Variation? Calculus of variations seeks to find the path, curve, surface, etc., for which a given function has a stationary value (which, in physical problems, is usually a minimum or maximum). Calculus of variation which will denoted by simply CoV • Finding geodesics i.e. shortest path between two points on a surface • In the CoV, the problems statement is usually ...

At this introductory course we will focus on the origins of calculus of variations: the study of the extrema1 of functionals de ned on in nite dimensional function (vector) spaces with real values.2 Namely, our goal is to study what is historically known as the fundamental problem of the calculus of variations (see Section 1.2).

Let $h \in C(a,b)$ and $Z \in C^1(a,b)$ $h(x) = \int_a^x h(x) dx = 0$ for all $C^1(0,a,b)$. Then $h(x) = 0$ on (a,b) . Proof. Assume $h(x_0) > 0$ for an $x_0 \in (a,b)$, then there is a $\delta > 0$ such that $(x_0 - \delta, x_0 + \delta) \subset (a,b)$ and $h(x) \geq h(x_0)/2$ on $(x_0 - \delta, x_0 + \delta)$. Set

The calculus of variations is a field of mathematical analysis that uses variations, which are small changes in functions and functionals, to find maxima and minima of functionals: mappings from a set of functions to the real numbers. Functionals are often expressed as definite integrals involving functions and their derivatives. Functions that maximize or minimize functionals may be found ...

systems. The title Variational Analysis reflects this breadth. For a long time, 'variational' problems have been identified mostly with the 'calculus of variations'. In that venerable subject, built around the minimization of integral functionals, constraints were relatively simple and much of the focus was on finite-dimensional function ...

- Fundamental Theorem of the Calculus of Variations – Let x be a function of t in the class \mathcal{C}^1 , and $J(x)$ be a differentiable functional of x . Assume that the functions in \mathcal{C}^1 are not constrained by any boundaries. – If x is an extremal function, then the variation of J must vanish on x , i.e. for all admissible η ,
$$\delta J(x, \eta) = 0$$
